

(TL)

Oil/Air-Cooling Systems
AKG-Range
TL1 - TL6

Technical Specification

General

Our TL range is designed to help you find an individual solution for your cooling application. Our TL cooling systems offer a wide variety of products which have been fully tried and tested, even under arduous working conditions.

A range of six basic types covers almost all cooling applications, involving a large variety of fluids in stationary and mobile machines.

AKG and its representatives as experts in the field of cooling systems will be delighted to assist you.

As part of our ongoing technical improvements, AKG maintains the right to introduce modifications to the specifications in this brochure.

Features

- Cooling systems are made from Aluminium
- Fully tried and tested for arduous working conditions
- Ideal for mobile machines
- Maximum working pressure 14 bar
- Offering a high flexibility for usage in transmission, hydraulic, engine and lubrication oils
- Cooling systems can be fitted with 12/24V DC and 3 Phase motors

Oil/Air-Cooling Systems

AKG-Range
TL1 - TL6

Benefits

- Short lead times
- Cost effective
- Cooling systems fully equipped for immediate use
- Easy to install
- Spares from stock
- Maintenance free

Applications

The units can be

used for cooling: mineral oil, synthetic oil, bio oil, HFA B C D liquids, water/glycol mixture, containing 50 % antifreeze and corrosion inhibitors

Function: Heat will be transferred from the fluid to the cooling air flow

Please note:

- Set up and operating instructions
- General Terms of Sales and Delivery
- Spares list

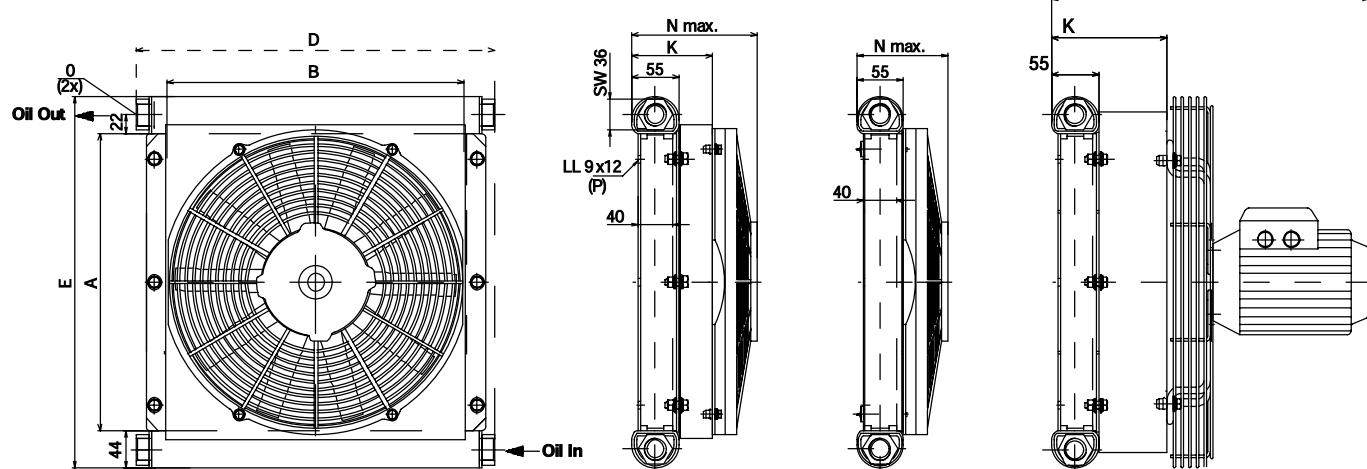

Technical Data

TL1 - TL6, with DC fan motor...

including shroud

without shroud

3 Phase motor

3 Phase motor: B14 small flange
 Depending on the motor the current and power will vary.
 For details see the name plate.

Materials

Cooler: Aluminium

Fan blade: Plastic

Fan shroud, finger guard: Steel (Zinc plated), Painted/Powder coated

Easy sizing of TL-coolers

The following tables may be used to quickly select a TL-cooler.

The data is based on the assumption that oil inlet temperature does not exceed 70 °C for hydraulic and 110 °C for lubrication applications.

Please use the following heat rejection figures if no details are available:

- Agricultural and construction machinery: 1/3 of Diesel engine power
- Hydraulic pumps driven by an electric motor: 1/3 of electric motor power

Hydraulic applications

Heat rejection [kW @ 30 °C ambient temperature]											
Oil flow in l/min	TL1	TL2	TL3	TL4	TL5	TL6	TL2	TL3	TL4	TL5	TL6
Including shroud							Without shroud, fitted with 12/24V DC fan motor				
10	1.8						2.2	3.2	6.0	6.2	10.4

60		2.7	4.4	5.6	6.8	10.8	2.1	3.3	5.1	5.4	9.2
80			4.8	5.7	6.9	11.4		3.6	5.3	5.6	9.8
100				6.0	7.1	12.0			5.4	5.9	9.9
120					7.2	12.2				6.0	10.2
150						12.3					10.8

Easy sizing of TL-coolers

For a more detailed and customised cooler selection exact temperatures and flows are necessary.

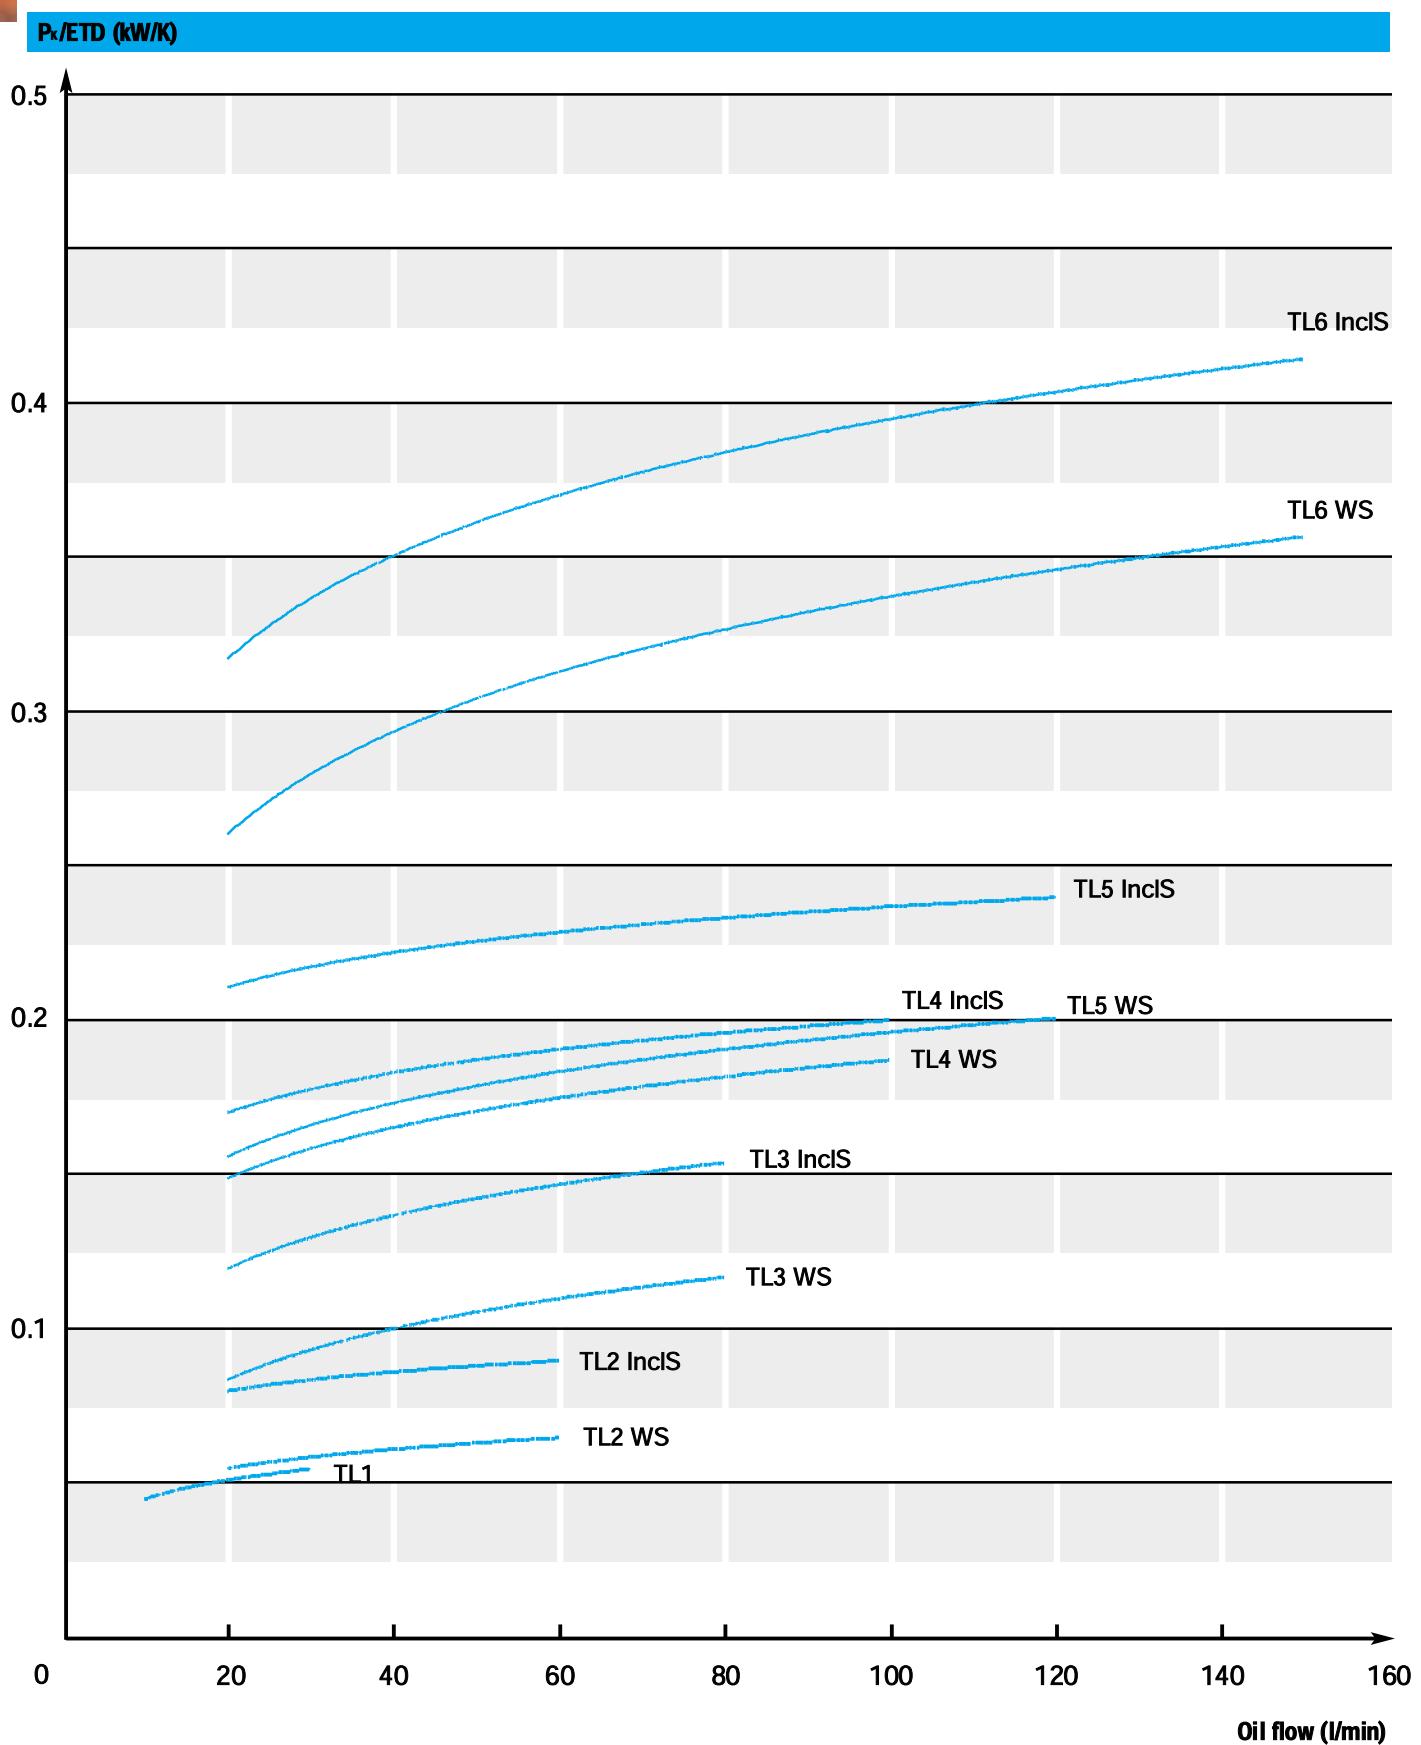

Please select your cooler according to the example on page 10 or seek advice from AKG or its representatives.

Lubrication oil applications

Heat rejection [kW @ 30 °C ambient temperature]											
Oil flow in l/min	TL1	TL2	TL3	TL4	TL5	TL6	TL2	TL3	TL4	TL5	TL6

150							28.7				25.2

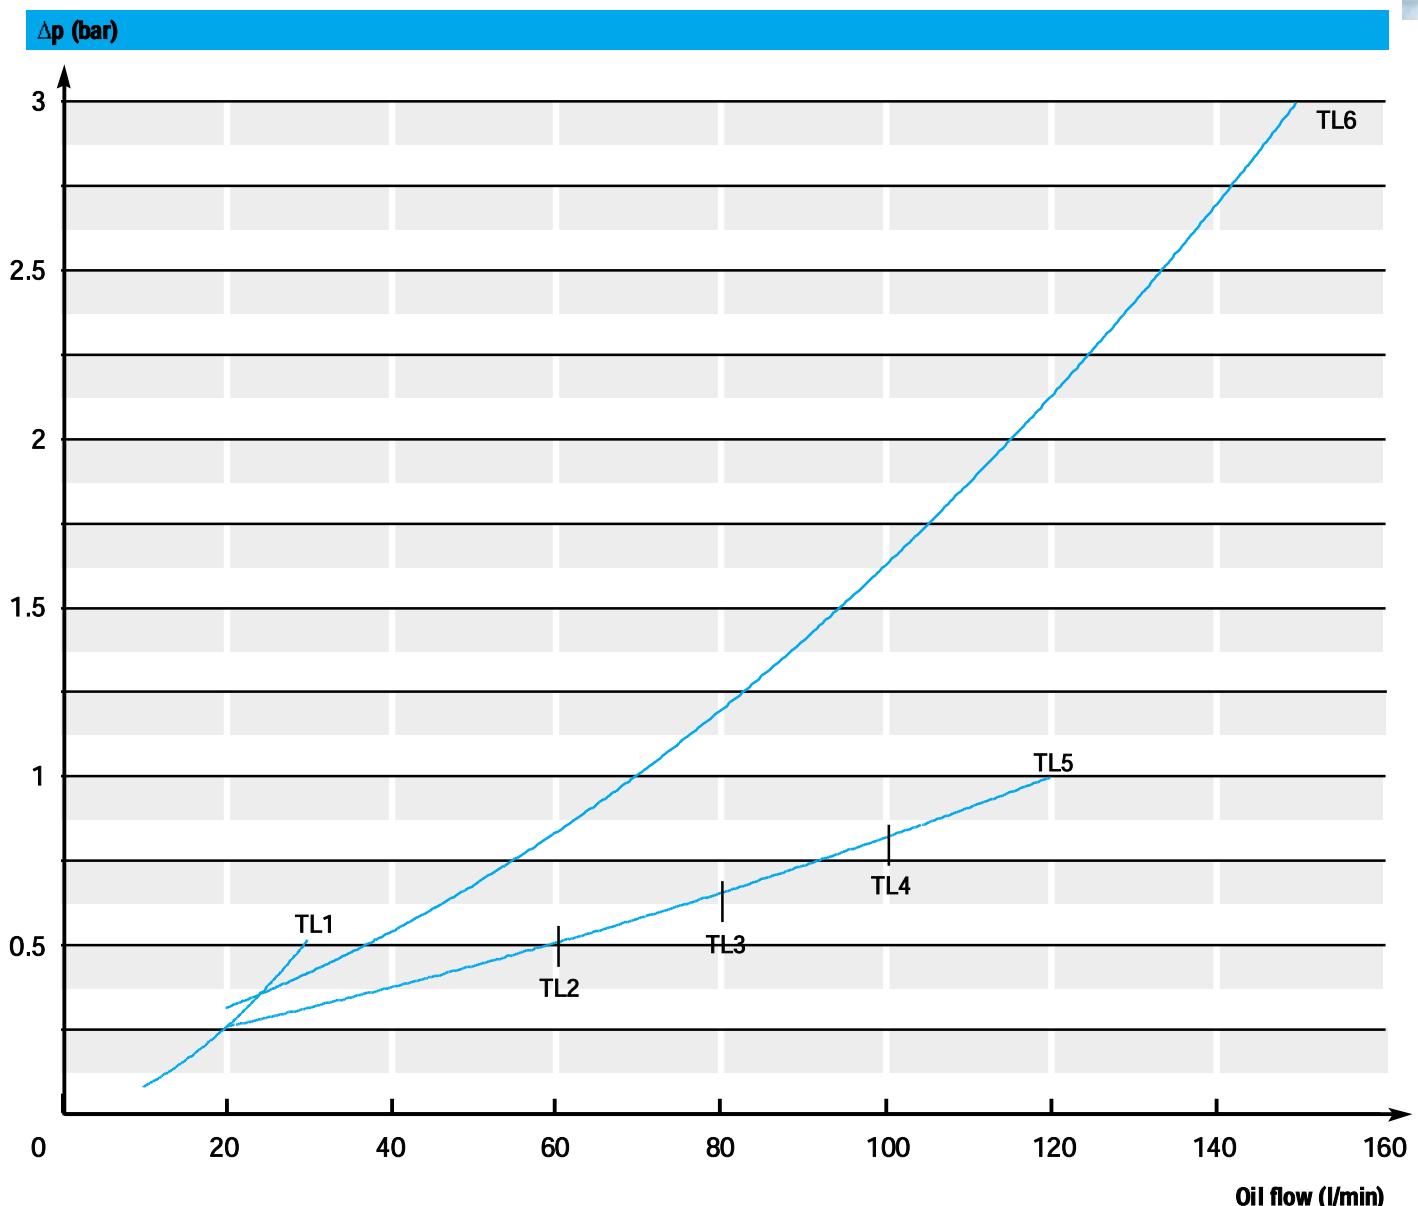

Specific heat rejection TL1 - TL6

InclS = Including shroud

WS = Without shroud

Pressure drop TL1 - TL6

The pressure drop curves are based on a viscosity of $30 \text{ mm}^2/\text{s} = 30 \text{ cSt}$.

Please use conversion factor f from page 11, to calculate pressure drop at other viscosity's.

Selecting a cooling system

To select a cooler for your application, the following data is required:

- **Heat rejection:** Alternative terminology is dissipation
- **Oil flow:** Circulating oil flow determines the cooler size
- **Oil inlet temperature:** Temperature of the oil entering the cooler
- **Cooling air flow temperature:** Air temperature at cooler face before entering matrix

1. Determination of input data

P_{req} [kW]	Heat rejection
V_{oil} [l/min]	Oil flow
T_{oil} [°C]	Oil inlet temperature
T_{air} [°C]	Cooling air flow temperature

Example

P_{req} = 10 kW
V_{oil} = 50 l/min
T_{oil} = 70 °C
T_{air} = 30 °C

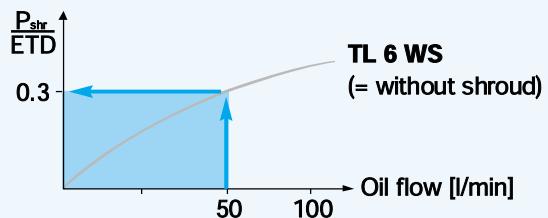

2. Specific heat rejection

$$ETD [K] = T_{oil} - T_{air} \quad \text{Entering Temperature Difference}$$
$$P_{shr} [\text{kW/K}] = P_{req} / ETD \quad \text{required specific heat rejection}$$

$$ETD [K] = T_{oil} - T_{air} \Rightarrow 70 \text{ °C} - 30 \text{ °C} = 40 \text{ °C} (= 40 \text{ K})$$
$$P_{shr} = P_{req} / ETD \Rightarrow 10 \text{ kW} / 40 \text{ K} = 0.25 \text{ kW/K}$$

3. Select according to diagram

$$P_{shr}/ETD [\text{kW/K}] \quad \text{actual specific heat rejection}$$
$$P = (P_{shr} / ETD) \times ETD \quad \text{actual heat rejection}$$

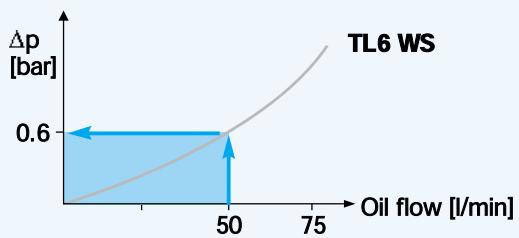

$$P_{shr} / ETD = 0.3 \text{ kW/K} \Rightarrow TL6 WS$$
$$P = 0.3 \text{ kW/K} \times 40 \text{ K} = 12 \text{ kW}$$

4. Pressure drop / Oil temperature difference

Obtain pressure drop @ 30 cST oil viscosity from diagram on page 9. To calculate for other oil viscosities please use example on page 11.

$$\Delta T_{oil} [\text{°C}] = 33 \times P[\text{kW}] / V_{oil} [\text{l/min}]$$

$$\Delta T_{oil} = 33 \times (12 \text{ kW} / 50 \text{ l/min}) = 7.9 \text{ °C}$$

5. Results

selected cooler TL6 WS: heat rejection 12 kW, oil temperature difference 7.9 °C, pressure drop 0.6 bar

Conversion factors for different oil pressure drops

The pressure drop curves on pages 9 are based on a viscosity of $30 \text{ mm}^2/\text{s} = 30 \text{ cSt}$.

Please use conversion factor f to calculate pressure drop at other viscosities.

$\frac{\text{mm}^2}{\text{s}}$, cSt	10	15	20	30	40	50	60	80	100
f	0.5	0.65	0.75	1.0	1.2	1.4	1.6	2.1	2.8

Example:

Pressure drop of type TL4 is 0.75 bar @ 90 l/min and $30 \text{ mm}^2/\text{s}$.

Assume an oil type ISO VG 46 is used @ 60°C having a viscosity of $20 \text{ mm}^2/\text{s}$.

To calculate new pressure drop multiply 0.75 bar by $f = 0.75$ to obtain the actual pressure drop 0.6 bar approximately.
