### 1 General information

The product range of Bucher Hydraulics SpA includes single pumps 05-100-212-212HP-250-300 (corresponding with the common group denominations: 05-1-2-2.5-3) and several combinations of double pumps, triple pumps, and so on, that can be assembled together according to versions of displacement, flanging, and auxiliary valves .

External gear pumps are widely used in modern hydraulic systems due to their high performance, long service life and low purchase and maintenance costs.

Here following we introduce you the new AP212 family range.

Product development of the new AP212 family has made it possible to achieve high operating pressures, excellent volumetric and mechanical efficiency and on specially developed units (LN – Low Noise) even lower noise levels.

This has been possible by means of:

- new design of gear teeth and balancing areas
- use of high-performance materials
- carefully controlled heat treatments

- increasingly tight coupling tolerances and a high standard of surface finish

- continuous development in our semi-anechoic room

Bucher Hydraulics has so achieved these results by constantly improving its design, control and manufacturing techniques inline with the latest technological developments, while simultaneously enhancing our Quality Control System which ensures that every single product offers the same high standards.

### 1.1.1 Improvements (New AP212 vs AP200)

**Front covers :**

In addition to aluminium versions, complete new range of cast iron front covers

**Balancing blocks :**

New generation optimised and standardised balancing blocks

**Gears :**

New gears profile (12 teeth) with increased transmissible torque

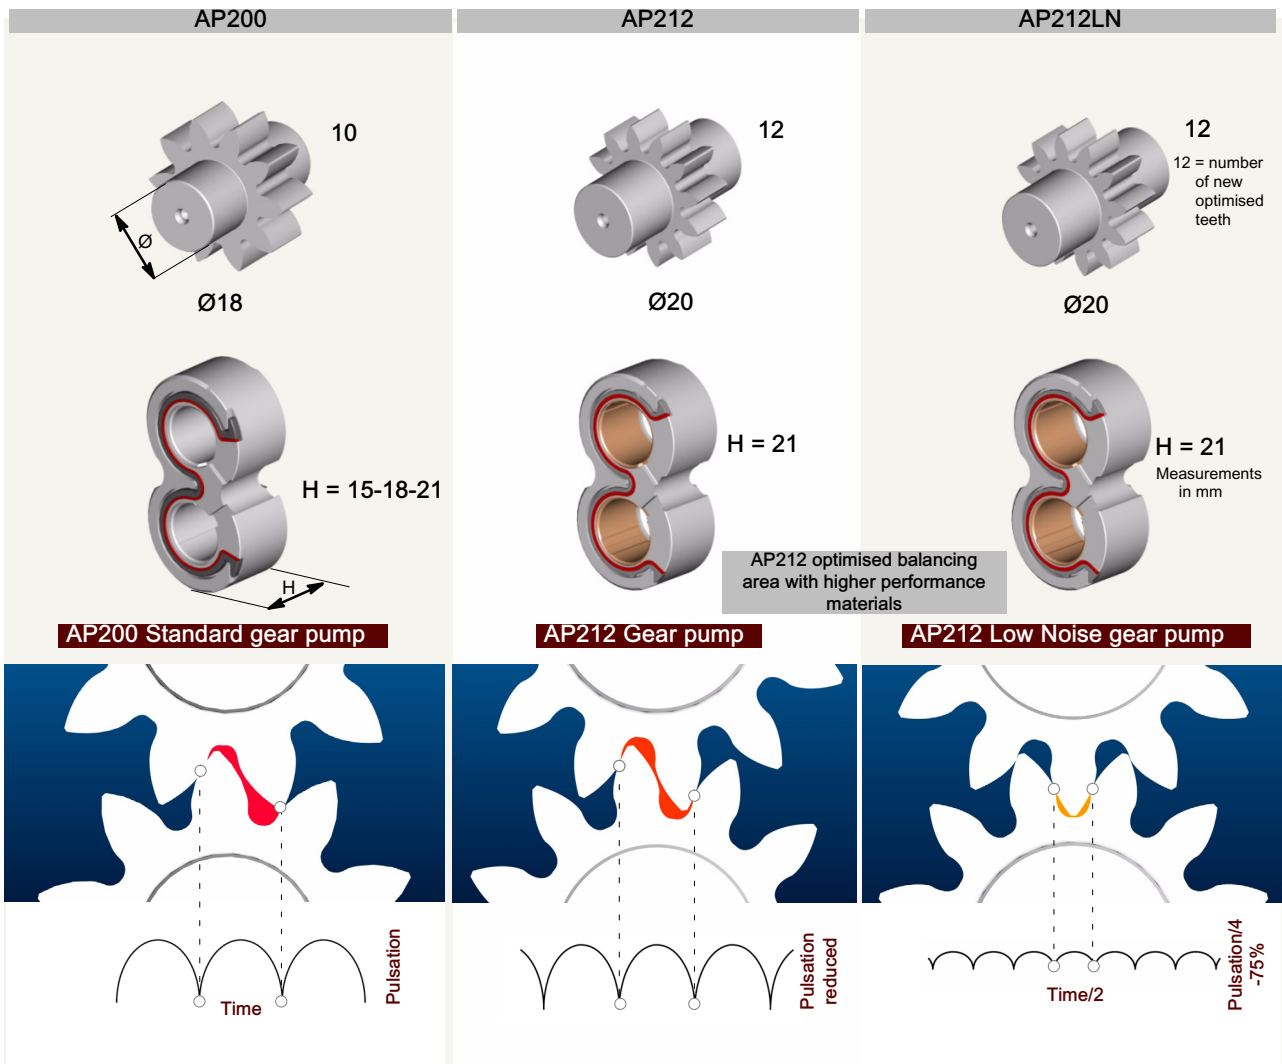

**Bodies:**

New design pump bodies

**Back covers:**

Wide range of aluminium and cast iron back covers with/without integrated cartridge valves

\* Referred to pumps and motors with flanged ports. Utilising threaded ports, please to consider a significantly de-rated performances.  
 The mechanical stress localised on threaded ports cause a reduced pump life performances

\*\* obtained with a specific balancing plate, please contact our Sales Center

**IMPORTANT!:** Please consult Bucher Hydraulics if even one of the operating limits indicated in the table (temperature, pressure, rpm) is exceeded, as well as in the case of two or more maximum values at the same time, or for applications with particularly heavy-duty cycles

### 1.4 Pressure

Pressure levels:

P1 = continuous pressure

P2 = intermittent pressure

P3 = peak pressure

The recommended oil speed in the pressure pipes is:

v = 2 to 5 m/s

## 1.5 Suction

The absolute suction pressure must be  $P_{in} \geq 0.75$  bar (11 PSI); therefore, the following conditions must be avoided:

- large height differences between pump and tank
- long stretches of piping
- special features such as:
  - bends
  - reductions in diameter
  - quick couplings
  - etc.

It is also advisable to choose a filter of a suitable size to minimise any pressure drop and to take measures to prevent gradual clogging over time.

(Example 1)

In certain cases, the suction pressure can exceed 1 bar (14.3 PSI), or atmospheric pressure.

Please contact our Sales Department, solution for

$P_{in} \leq 3.5$  bar (50 PSI), are available.

If in a particular application the  $P_{in}$  pressure is higher than the recommended value, contact our Sales Office.

The diameter of the suction pipe should ensure that the oil speed will fall within the range:  $v = 0.6 - 1.2$  m/s.

(Example 2)

## 1.6 General precaution

In addition to the recommendations regarding fluids, filtration, coupling, etc., we suggest the following:

- Always check the rotation direction of the pump's drive shaft; it must be compatible with the rotation direction of the pump itself.
- Be particularly careful in cleaning and make sure, when connecting the suction and pressure piping, that no chips, rag threads, teflon tape, etc. get into the pump circulation system.
- Check the tightness of the suction and pressure fittings, the correct positioning of the O-Ring, and make sure there is no dirt between the flange and the pump body.
- The first pump start-up can be facilitated by manually filling the suction piping and the pump itself with oil. To facilitate air bleeding, start the pump with the circuit not pressurised.

- To ensure the best heat distribution inside the tank, make sure the return pipe is not too close to the pump's suction piping. The pipings themselves should be below oil tank level to prevent the formation of foam.
- Do not subject the pumps to operating conditions different from those indicated on section 1.3; for extreme operations, always contact our Technical Department.
- Never use fluids different from those indicated in section 1.3 and do not use fluids incompatible with the pump seals (i.e. HNBR)
- In the event of pump painting, do not use solvents or paints that are incompatible with the material of the seals. Do not bake paint with excessively high temperatures. Do not paint over the product identification plate.

### 1.6.1 Directives and standards

Atex

Attention: The equipment and protective systems of these catalogue ARE NOT intended for use in potentially explosive atmospheres that is to say where there is an explosive atmosphere referred to in Article 2 of the Directive 99/92/EC and referred to Article 1.3 of the Directive 94/9/EC

Machinery safety

Hydraulic pumps are excluded by Directive 2006/42/EC

- ISO 9001:2008 / ISO 14001:2004

Bucher Hydraulics S.p.A. is certified for research, development and production of directional control valves, gear pumps and motors, power units, electro pumps, cartridge valves and integrated manifolds for hydraulic applications.

## 1.7 Identifying the rotation direction

The rotation direction of a gear pump is identified by looking at the pump from the front and with the drive gear turned upwards (see figures below).

Pumps with clockwise rotation (**D**) have a drive gear which turns clockwise, with the suction port on the left and the pressure port on the right.

Pumps with counterclockwise rotation (**S**) have a drive gear which turns counterclockwise, with the suction port on the right and the pressure port on the left. The figure also shows the pressure flow inside the pumps as the oil is transferred from the suction port to the pressure port.

As regards reversible pumps (**R**), the ports are alternatively for suction and pressure.

Pumps with a unidirectional rotation (**D** or **S**) have the denomination **AP**.

Pumps with reversible rotation have the denomination **APR**.

Pumps with "Low Noise" components have the denomination **LN**.

## 1.8 Motor-pump coupling

Absolutely no radial or axial forces should be transmitted to the drive shaft in the motor-pump coupling.

Such forces cause rapid and irregular wear on the balancing surface of the bushings and gear support, with a consequent worsening in pump performance.

The coupling joint must be able to absorb any discrepancies in the coaxial alignment of the motor-pump shafts without placing any load on the pump shaft.

In the couplings between splined shafts, the connecting sleeve must be free to move along its axis.

The length of the sleeve must be sufficient to cover the splined sections of the motor-pump shafts completely in any position.

A clearance between shaft ends it is necessary.

Make sure that the splined coupling is suitably lubricated to protect it against rapid deterioration.

If there are radial and/or axial loads on the drive shaft, such as when it is driven by a V-belt and pulley or pair of gear wheels, it should be fitted with a front cover with supporting bearings. (See examples in section 3.4.3 )

Depending on the pump model concerned, these supports can replace the front cover of the pump or can be fitted in addition to and over the front cover.

### 1.9 Non-standard symbols used in the text

### 1.10 Calculating the specification of a gear pump

The following parameters are defined:

$V_c$  = (cm<sup>3</sup>/rev) pump displacement;

$n$  = (rev/min) no. of rpms of the drive shaft;

$Q$  = (l/min) flow rate;

$p$  = (bar) operating pressure;

$T$  = (Nm) drive torque;

$N$  = (kW) Absorbed power;

$\eta_v$  = (%) volumetric efficiency;

$\eta_m$  = (%) mechanical efficiency;

$\eta_t$  = (%) total efficiency

$$Q = \frac{V_c \cdot n}{100000} \cdot \eta_v$$

$$T = 1.59 \cdot \frac{p \cdot V_c}{\eta_m}$$

$$N = \frac{Q \cdot p}{6 \cdot \eta_t}$$

#### Example

AP212/11  $V_c = 11.1 \text{ cm}^3/\text{r}$   $n = 1500 \text{ r/min}$   $p = 200 \text{ bar}$   $\eta_v = 94\%$   $\eta_m = 90\%$   $\eta_t = 84.6\%$

$$Q = \frac{11.1 \cdot 1500}{100000} \cdot 94 = 15.65 \text{ l/min.}$$

$$T = 1.59 \cdot \frac{200 \cdot 11.1}{90} = 39.2 \text{ Nm}$$

$$N = \frac{15.65 \cdot 200}{6 \cdot 84.6} = 6.56 \text{ kW}$$

In the next pages, front, rear cover, and seals materials are listed for each pump series.

For ordering purposes, it is enough to outline the complete pump description (for example: AP212/4.5 D 218).

In case of a different configuration request (or a combination of different features, such as port threads, front flange materials, etc.), the description configurator shown in section 3.1 can be easily used.

### 3 AP212 Single pump customised versions

---

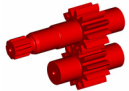

In this section, a single AP212 pump can be configured and customized.

AP212 wide availability of covers, bodies, gears and seals sets provides great flexibility to AP212 pump range and allows several different pump configurations.

In order to simplify the selection of the desired pump combination, a 'configurator form' is available and, by filling it out, it will guide you in the pump creation process.

		T max = 100 Nm X = 45 mm (1.77 inches)				
	+		+	Shaft seal material: HNBR	=	C1
		T max = 100 Nm Straight 22 mm - 0.87 inches X = 48.5 mm (1.91 inches)				

Front bearing should be utilized in presence of radial and/or axial load. If there are radial and/or axial loads on the drive shaft, such as when it is driven by a V-belt and pulley or pair of gear wheels, it should be fitted with a front cover with supporting bearings. (See example 1 and 2)

Depending on the pump model concerned, these supports can replace the front cover of the pump or can be fitted in addition to and over the front cover.

## 3.5 Body

For reversible pumps alternative inlet and outlet ports have the same sizes as per inlet unidirectional rotation.

## 3.6.5 Pressure relief valve : \*\*VM01C VI\*\* and VE\*\* pressure setting range

Direct acting  
Balanced piston  
Adjustable setting  
Four setting ranges

Max. Pressure ..... 350 bar \*\*\*  
Max flow rate ..... 60 l/min.  
Temperature range ..... -20/+100 °C  
Weight: ..... 0.155 Kg.

(\*\*) Assembly instruction:  
Check the correct position of the front copper washer and tighten with a torque wrench at the indicated value

The valve can be sealed against tampering

Pressure viscosity characteristic 46 cSt at 40°C

(\*) see performances trace/minimum pressure setting (---)

The purpose of a relief valve is to keep the maximum system pressure at a safe level. When the external gear pump is supplied with pressure relief valves, the correct calibration is provided by Bucher Hydraulics S.p.A. and there are no reasons to change this value. When ordering, state in full the sheath part number, and, if the valve is to be supplied with sheath already fitted, the relief pressure setting required.

\*\*\* Maximum admitted pressure value: referred to valve only. For max admitted values see pump limits.

## 4 Multiple gear pumps

The multiple external gear pumps standard version includes an intermediate cover without shaft seal between the pumps.

If needed, it is possible to order a customised version with intermediate seal, see section 4.3.

### 4.1 Drive torque

$$T_{\max} = T_1 + T_2 \text{ <see section 3.3>}$$

Drive gear 1st pump

$$T_{\max} = 1.59 \cdot \frac{p_1 \cdot V_{c1}}{\eta_{m1}} + 1.59 \cdot \frac{p_2 \cdot V_{c2}}{\eta_{m2}}$$

Example: AP212/19 + AP212/15

$$T_{\max} = 1.59 \cdot \frac{19.2 \cdot 200}{90} + 1.59 \cdot \frac{15.1 \cdot 100}{90} = 68 + 26.7 = 94.7 \text{ Nm}$$

$$T_{\max} = 94.7 \leq 130 \text{ Nm}$$

(taper 1:8)

$$T_2 = 26.7 \leq T_{\max} 100 \text{ Nm}$$

## 5 Circuits/valves option

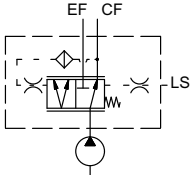

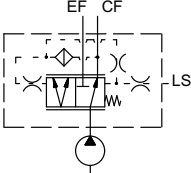

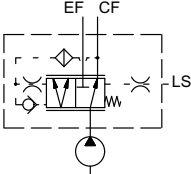

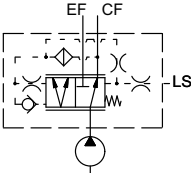

For Technical features and availability please contact our Sales Department

### 5.1 Load sensing circuits

#### 5.1.1 Load sensing valve rear cover assembly position

Hydraulic scheme	Family	Description	Code
	STATIC	Static LS signal	LSB01
	DYNAMIC	Dynamic LS signal	LDB01
	STATIC	Static LS signal + check valve on CF line	LSB02
	DYNAMIC	Dynamic LS signal + check valve on CF line	LDB02
	STATIC	Static LS signal + relief valve on LS signal	LSB03
	DYNAMIC	Dynamic LS signal + relief valve on LS signal	LDB03
	STATIC	Static LS signal + check valve on CF line and relief valve on LS signal	LSB04
	DYNAMIC	Dynamic LS signal + check valve on CF line and relief valve on LS signal	LDB04

### 5.1.2 Load sensing valve lateral assembly position

Hydraulic scheme	Family	Description	Code
	STATIC	Static LS signal	LSS01
	DYNAMIC	Dynamic LS signal	LDS01
	STATIC	Static LS signal + check valve on CF line	LSS02
	DYNAMIC	Dynamic LS signal + check valve on CF line	LDB02

## 6 Rotation changing instructions

For the AP212 pumps with unidirectional left (S) or right (D) rotation (not for 287S-SAEB pump) it is possible to change the rotation direction of the entire range without having to replace any component. To ensure a good technical result, we recommended in any case that such inversion should be carried out at our factory.

Following we represented a procedure for the pump rotation inversion, here in example a counter-clockwise rotation pump (S). To obtain an clockwise-rotation (D) see the following pictures/instructions.

Initial configuration "Left" (S)

## 7 Pumps seal kit NBR standard type

The seal Kit code includes:  
OR and shaft seal

Type	Code
AP/APR212	200974001570
Tandem AP212 + AP212 NBR (without shaft seal between the pumps)	200974001580
Tandem AP212 + AP212 + PAR NBR (with shaft seal between the pumps)	200974001590

Minimum kit order quantity is requested: please contact our Sales Center.

## 8 Product identification plate

1 : Rotation (D= Clockwise rotation - S= Counterclockwise rotation)

2 : Manufacturing year and month

3 : Progressive identification no. (optional)

4 : Bucher Hydraulics S.p.A. product code

5 : Description

### Single pumps approximate weights

Pump	Weight Kg
AP-APR212/4.5	2.5
AP-APR212/6.5	2.6
AP-APR212/8.5	2.7
AP-APR212/11	2.8
AP-APR212/15	3.0
AP-APR212/19	3.2
AP-APR212/22	3.3
AP-APR212/26	3.4

N.B.: The weight refers to pumps with aluminium front cover and standard cast iron back cover.
